                                                                                                               The NBP46 root lectin is instrumental in recognising and binding to nitrogen fixing rhizobial bacteria via a lectin-carbohydrate interaction. The production of transganic plants comprising an expression cassette expressing the NBP46 root lectin is advantageous since it would mean that non-leguminous plants could fix nitrogen from the atmosphere, lessening the need for the addition of nitrogen containing fertilizer to soil. This would lead to higher crop yields where soil has been overplanted and replenishment of the depleted soil with usable nitrogen. Alternatively, expression of NBP46 can be used to medulate oligosaccharide signalling in the plant. The nucleic acid sequences can be used to inhibit expression of an endogenous gene and also to suppress endogenous NBP46 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120
